

Pocket Portfolio

Building the Global Security Layer for Financial Intelligence.

Abba Lawal – immigrant founder. UK regulatory edge → global scalability (US, EU, Asia).

Split-Brain architecture: deterministic edge compilation + stateless frontier reasoning

The Villain: Sovereignty Lockout

A ~\$100T AUM industry is locked out of the AI revolution

- Global wealth cannot adopt frontier reasoning if raw ledgers must cross borders.
- Data residency + retention risk turns AI features into a regulatory liability.
- Result: incumbents stall — and the market waits for an infrastructure breakthrough.

Why Now

Frontier reasoning matured. Compliance tightened. The gateway market is opening.

- LLMs now deliver analyst-grade reasoning — but regulated firms cannot export raw portfolios.
- Mid-market WealthTech needs an “AI layer” without becoming a raw-ledger data processor.
- Winning pattern: minimize egress, prove boundary, keep inference stateless.

The Solution: Stateless AI Gateway

Privacy without the utility trade-off

- Default mode: raw ledger stays local; only aggregates cross the boundary.
- Server is stateless: (context, question) → streaming answer.
- Audit narrative is built into architecture, not bolted on.

The Proprietary Moat: Structural Compliance

A UK company can serve banks globally without data residency headaches

Figure 2 — Hybrid Architecture

Edge compiles PII-free aggregates locally. Stateless API streams answers – no payload database.

Velocity: Global Demand Signal

Not a local project – a global platform with a Salford HQ

Global footprint (GSC clicks):

Top countries: India · United States · Germany
Also present: Vietnam · Cambodia

pocket portfolio: pos 4.24 (45 clicks)
trade republic export csv: pos 6.45 (5 clicks)
trade republic csv export: pos 7.53 (4 clicks)

Note: rankings are directional; positions in export are ~6–8 for Trade Republic CSV terms.

Market Opportunity

Compliance-constrained AI in WealthTech is an infrastructure wedge

- The world's wealth industry is primed for AI — but sovereignty blocks adoption.
- ICP: WealthTech platforms and banks that need “AI features” without becoming a data exporter.
- A compliance-first gateway is the fastest path to global rollout.

The Moat: Architecture-Based Compliance

Structurally incapable of leaking raw ledgers (by default)

- Sanitization by construction: edge compiler outputs aggregates only (no raw rows).
- Stateless boundary: no server-side portfolio DB to breach.
- Auditable payload minimization: network tab shows bounded context size.
- Optional attachments are opt-in and tier-gated (speaker note).

Business Model

B2B Enterprise API – with a B2C lab as our unfair advantage

B2C App = Data & Testing Lab

Founders Club: GBP 12/mo

Refines sanitization algorithms with real-world edge cases

B2B Enterprise API

Usage-based gateway

Stateless Financial AI API for banks + WealthTech

Monetization engine live; first conversion secured; 4,700+ users in the high-intent pipeline.

Revenue reporting: track separately from GA exports (GA snapshot total revenue = 0).

Team + Ask

Partner with Tech Nation's iconic founders to scale globally

- Abba Lawal — immigrant founder building the global security layer for financial intelligence.
- Ask: introductions to iconic immigrant founders + early design partners in banks / WealthTech.
- Goal: scale Pocket Portfolio into the global standard for Stateless Financial AI.

Next 90 days: 1) Convert global demand into B2B pilots 2) Ship “audit-ready boundary pack” 3) Expand provider partnerships
