

Privacy-First Financial AI

Sovereign Intelligence: Local-First RAG for Finance

Sovereign Intelligence

Building Local-First RAG for Finance

POCKET PORTFOLIO

TECHNICAL PRESS

Pocket Analyst, context engine,
and data sovereignty

The industry standard is a privacy nightmare

"The default for building AI apps is to ship raw user data to the cloud. In fintech, that breaks the fundamental rule of data sovereignty. Your ledger should not live in someone else's training set."

We move the AI to your data, not your data to the AI

Memory (trades, positions) stays in the browser. Only a sanitized context crosses the wire.
The API is stateless: (context, message) → stream.

Figure 2 — Hybrid Architecture

Local-First Data Boundaries

"IndexedDB holds the raw ledger. The context builder compresses 10,000 trades into a token-efficient summary. Only that summary and the user message go to the LLM."

Boundary	Contents
Browser	IndexedDB, Redux, full trade history, context builder, CSV parse (transient)
Server	Sanitized context string + user message → Gemini; no storage of ledger or PII

Read the complete blueprint

"We published the exact architecture running in production at Pocket Portfolio. 25,000 words. Free."
